# Agenda

- General tips for setting up wireless devices
- The interfaces of an Access Point
- Steps in configuring an Access Point
- Examples: Screenshots

# General tips

- **You will need ....**
  - a PC/laptop with wireless and ethernet interfaces
  - standard TCP/IP software tools (ping, route, etc) and maybe vendor specific software
  - wireless signal/survey software
- Get to know the device and its default settings. **Read the manual.**
- **Consider the physical installation:** placement, power supply, antennas, temperature and humidity ... and all other factors that are not software related.  
(we focus on the software configuration in this unit!)

# General tips

- **Plan the network (TCP/IP) before you start** - this includes knowing your ISPs or LAN settings, DNS, etc.
- **Look around you** before you start: look for other wireless networks ... avoid conflict **and cooperate!**
- **Consider naming** of networks / choice of SSIDs
- **Make security decisions** (WEP, MAC, ...)

# General tips

- Make sure you have all documentation and material – so you will **be able to work even if you should disconnect yourself** during the process
- **Make a plan and a drawing** before you start.
- **Take notes (on paper!)** about every step, especially when changing IPs and network settings

# The interfaces of an Access Point

- Typically you find:
- **the ethernet side: often called WAN / LAN** – typically to an ISP, an internet connection, or a LAN.  
A pure Access Point only has this one ethernet port.
- **the wireless side: often called WLAN** - to local network / wireless clients. Sometimes called the *radio* side.
- Often you find Wireless Routers/Gateways – they have additional ethernet ports on the local network side and do more than pure Access Points. Don't get confused!

6/23/05

# Let's start!

## Steps in configuring an Access Point

# Steps in configuring an AP

- **Reset** the device,  
if you are uncertain if it is in default state.
- **Connect** your computer to it - wired or wireless
- First thing: **change the default** Admin password. Do it!  
**Now! :)**
- If your device can be more than a pure Access Point:  
**Set the Mode:**  
Access Point, Bridge, Client, Repeater, Gateway?

# Steps in configuring an AP

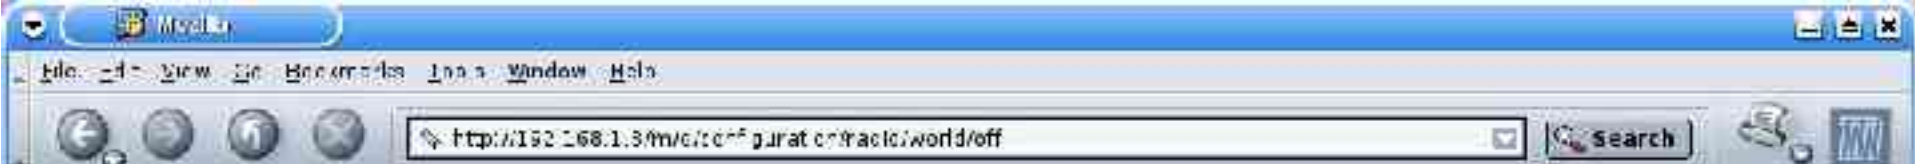

- **Do the IP settings** – IP Adr, Netmask, Gateway, DNS, ...
  - then adjust your computers settings, if needed
- **Set the Channels and SSID**
  - then adjust your computers settings, if needed
- **Make security related settings** WEP, MAC address control, VPN
- **There is more** – for example the advanced wireless settings - so go through all other settings, and at least try to understand what they do ...

# Examples: Screenshots

- We are showing **browser interfaces** only here – there are also proprietary setup utilities, but browser interfaces are standard and preferable.
- The **interfaces look different** from vendor to vendor, from model to model, and they change all the time – **but they all contain the same basic elements.**

# Examples: Screenshots

Item	Value
Service set identification	a string of at least 1 characters <input type="text" value="free78 wire mesh dl"/> <input type="button" value="Save"/>
Allowed rates in megabits/second	1, 2, 5.5, 11, 2, 2 5.5, 2 11, 5.5, 5.5 11 or 11
Basic bit rates in megabits/second	1, 2, 5.5, 11, 2, 2 5.5, 2 11, 5.5, 5.5 11 or 11
Enable world mode	<a href="#">on</a> or <a href="#">off</a>
4.8/CTS packet size threshold	a number of 2400 or less <input type="text" value="2448"/> <input type="button" value="Save"/>
<a href="#">Privacy configuration</a>	
Parent node id	our parent's network address <input type="text" value="any"/> <input type="button" value="Save"/> or any
Time to look for specified parent	<a href="#">off</a> or a time in seconds <input type="text" value="off"/> <input type="button" value="Save"/>
Maximum number transmit retries	a number from 8 to 64 <input type="text" value="64"/> <input type="button" value="Save"/>
Refresh rate in 1/10 of seconds	a number from 5 to 150 <input type="text" value="100"/> <input type="button" value="Save"/>
Transmit power level	1, 5, 20, 30, 50 or full
Maximum fragment size	a number from 256 to 4000 <input type="text" value="2340"/> <input type="button" value="Save"/>
Enable radio options	a password <input type="text"/> <input type="button" value="Save"/>

## Linksys

- If you look closely, you will notice that this is more than a pure access point ...

it is a router/gateway!

(try to find out why!)

### Configuration Type

Connection Type: **Static**

IP Address: **192.168.1.3**

Subnet Mask: **255.255.255.0**

Default Gateway: **192.168.1.1**

DNS 1: **83.229.21.8**

DNS 2: **217.194.158.30**

DNS 3: **212.242.40.3**

# Examples: Screenshots

## That last one was not really a Linksys ...

- Many vendors today use Open Source (GPL) firmware – this leads to truly open software for these models: people rewrite and modify and improve the firmware.
- For example, there are many alternative firmware projects for the Linksys WRT54G:  
OpenWRT, EWRT, Batbox, wifibox, Sveasoft, Pebble ...
- Accordingly, you will see many different browser interfaces with many different options
- Next, we will show two free software web interfaces:  
OpenWRT on a Linksys WRT54G  
WifiAdmin on a Metrix AP

# Conclusion

- Follow general guidelines for setting up wireless devices
- Remember general steps in setting up an Access Point or Wireless Router
- An understanding of the interfaces of an Access Point (and those of a wireless router)
- See that most of this is independent of the specific vendor or interface – the important part is to recognize the basic settings, even if they come under different names and in different colors
- We have seen examples of different colors and designs in the screenshots
